Introduction to OpenGil:

OpenGil is a software interface that allows a programmer to. Communicate with graphics hardware. OpenGil 48 the short form for "Open Graphics library". It is an application programming interface (API designed for rendering 2D and 3D graphics. It provides a common set of commands, that can be used to manage graphics in different applications and on multiple platforms. Examples of OpenGil commande enclude drawing polygons, assigning colors to shapes, zooming en and out, rotating objects etc.

OpenGil Utelety Toolkit (GilUT) has been created to aid in the development of more complicated 3D objects such as a sphere, a forus and even a feapot. Like all software Mibraries, Open Gil consists of a series of function calls that can

be invoked from our own programs.

3. Why OpenGih?

-> The first vendor-independent API for development of graphics applications.
-> There is no need to license it to use it.

→ It was designed to use the graphics card where possible to improve performance.

→ Originally based on a state machine, procedural model; thus it can be used with a wide variety of programming languages.

@. Callback Functions:-

A callback function 48 a function which the lebrary (GLUT) Calls when It needs to know how to process something. Eg. When GILUT gets a key down event it uses the glutkeybound Func callback routine to find out what to do with a key press. The following are some valed callback functions:-

Callback	Description
GILU_TESS_BEGIN	The GILU_TESS_BEGIIN callback 48 anvoked
William Halonda	like glbegin to endicate the start of a
The state of the s	(triangle) primitive. The function takes a.
	single argument of type Ghenum.
GLU_TESS_BEGIN_DATA	GLU_TESS_BEGIN_DATA 98 same as GILU_TESS_BEGIN
· Del and teachers	callback except that It takes an additional
	pointer argument.
GILUTESS_EDGE_FLAG	The GILU_TESS_EDGE_FLAG, callback 18
2.7 (3.5)	Similar to glEdge Flag. This function takes a single bookean flag that indicates which
	a single boolean flag that indicates which
	layer lay on the polygon boundry
GILUTESS_EDGE_FLAGDATE	The GILU_TESS_EDGE_FLAGIDATACALIBACK 12 400
	Same as GLU_TESS EDGE PLAC IILAND
	cuceff it takes an additional actual
	argument.
GILU_TESS_END	The GILU_TESS_END callback indicates the
	end of a primitive, and st takes no arguments.

@. Color Commands:-

Open Gil has two color models: the RGBA mode and color andex mode. In RGBA mode, a color as specified by three Intensities (for the Red, Green and Blue components of the color) and optionally a fourth value, Alpha, which controls transparency. The function, glcolor4f (red, green blue, alpha)

maps available red, green, and blue intensities onto (0.0, 1.0) where 0.0 means that the color component is absent (0.0, 0.0, 0.0) which indicates black and 1.0 98 a saturated color (1.0, 1.0, 1.0) which indicates white.

The number of blas used to represent each color depends upon the graphics card. Current graphics cards have several Mbytes of memory and use 24 or 32 bets for color. The term bit plane refers to an image of single-bit values. Thus a system of 24 bits of color has 24 bit planes.

Drawing pixels, lines, polygons using Open Gil:-

Creating Lines on OpenGil -> In OpenGil, the term line refers to a line segment. There are easy ways to specify a connected series of line segments, or even a closed, connected series of segments. In all cases the clines constituting the connected series are 1 Specified en terms of the vertices at their enapoints.

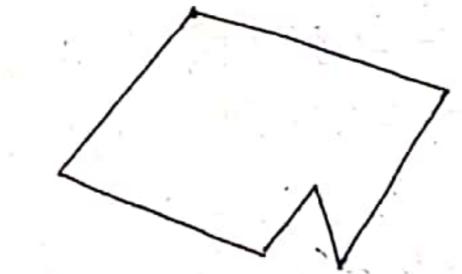

fig. two connected series of line segments.

Weth OpenGil, we can specify lines with different widths and lines that are stippled in various ways-dotted, dashed and so on. Drawing a line with OpenGil is apparently quite simple using the following code.

glBegen (GILLINES);
glVerlex29 (xo,yo); gl End(); gl Verlex 21 (x, y);

Greating Polygons in Open Gil -> Polygons are typically drawn by filling in all the pixels enclosed within the boundry, but we can also draw them as outlined polygons or simply points at the vertices. A filled polygon might be solidly filled or stippled with a certain pattern.

Scanned with Camscanner

A polygon has two stdes front and back and might be rendered differently depending on which stde is facing the viewer. This allows us to have cut away views of Solid objects in which there is an obvious distinction between the parts that are inside and those that are outside. By default, both front and back faces are drawn in the same way to change this, or to draw only outlines or vertices, use

gl Polygon Mode (),

We can draw polygon by using following code segment;

gl Begin (Gil_POLYGON); //Draw a Quad

gl Vertex 3f (-0.5f, 1.0f, 0.0f); //Top.

gl Vertex 3f (-1.0f, 0.0f, 0.0f); //Left.

gl Vertex 3f (-0.5f, 1.0f, 0.0f); // Bottom Left.

gl Vertex 3f (0.05f, 1.0f, 0.0f); // Top sight

gl Vertex 3f (1.0f, 0.0f, 0.0f); // Right

gl Vertex 3f (0.5f, 1.0f, 0.0f); // Bottom Right

gl End ();

@. Basic Lighting:— Lighting in the real world is extremely complicated and depends on way to many factors. Lighting in OpenGil is based on approximations of reality using simplified models that are much easer to process and looks relatively similar. These lighting models are based on the physics of light as we understand it. The major building blocks of the Phong lighting model. following three components;

Ambient lighting > Even when it is dark there is usually still some light somewhere in the world (the moon, a distant light) so objects are never almost never completely dark. To simulate this we use an ambient lighting constant that always gives the object some color. Ambient illumination is light that's been scattered so much by the environment that it's direction is impossible to determine. It seems to come from all directions.

Of the lighting model. The more a part of an object faces the light source, the brighter it becomes. The diffuse component is the light that comes from one direction, so it is brighter if it comes squarely down on a surface than if it barely glances off the surface. Once if hits a surface it is scattered equally in all directions, so it appears equally bright.

Fre Specular brothing > It simulates the bright spot of a light that appears on shiny objects. Specular highlights are often more inclined to the color of the light than the color of the object. Specular light comes from a particular direction, and it stends to bounce off the surface of the surface of preferred direction. Shiny metal or plastic has a high specular component.
